

Water and Contaminant Shed Design

Door Components has designed a unique profile that sheds water and contaminants. This patent-pending design is expected to become the standard in the hollow metal frame industry

- Slope design sheds water, dust, and other contaminants, rather than allowing it to collect
- Glass stop is placed on interior side, eliminating risk of water intrusion through holes drilled in the hollow metal frame
- Recommended by architects and specifiers for standard use on all projects
- No additional manufacturing time required
